

# WEEDKILLERS

## Boots Potato Weedkiller EC 20

Packed in 5 litre containers

Potato Weedkiller EC 20 is a 20% emulsifiable concentrate formulation of linuron and monolinuron in the ratio 70:30 for the selective control of a wide range of annual weeds in both early and maincrop potatoes.

### Advantages of Potato Weedkiller

1. Contains linuron and monolinuron – this unique mixture controls a very wide range of annual weeds including annual grasses, chickweed, charlock, polygonums, hempnettle and mayweeds.

2. Has a useful degree of contact action and excellent residual effect – this affords early and continued weed control (up to eight weeks dependent on season).

3. Compatible with Gramoxone W\* – the delaying of application until after weed emergence is often practised where resistant weeds (e.g. wild oats) are known to be present, or where late germinating weeds, such as redshank or fat hen are likely to be a problem; thus by tank mixing of Gramoxone W\* with Potato Weedkiller a good kill of all emerged weeds is possible, while at the same time, extending the period of time that the crop remains weed-free due to residual actions.

ALL APPLICATIONS MUST BE MADE BEFORE CROP EMERGENCE

\*Gramoxone W is the trade mark of I.C.I. Plant Protection and should be added at a minimum rate of 2 pints per acre (2.8 litres per hectare).
