

## **“MORE FERTILIZERS MEAN MORE FOOD”**

---

Mr. Hudson has made an urgent appeal to farmers to use sulphate of ammonia this spring to increase the production from our soil. “More fertilizers mean more food,” he says, “and the nation needs more food from our own soil; in fact, the maximum we can get. All crops will give an increase, in many cases a very useful increase, from an application of nitrogen. I consider it the duty of every farmer to apply at least 1cwt. an acre of sulphate of ammonia to all cereal crops this spring, unless the land is in exceptionally good heart. In many cases 1½cwt. or 2cwt. will be needed to produce the increases which the nation requires. Potatoes, sugar beet, and roots should have at least 2cwt. an acre of sulphate of ammonia or its equivalent in other fertilizers or compounds. We must also make the fullest use of the remaining grassland. A February application of 1cwt. on suitable fields will help the feeding-stuffs position. “You all know the difficulties of transport. We can only overcome them if you will work out your requirements now, and place your order at once with your merchant.”
