If you break a Spearwell Tool within 10 years we'll give you a new one free.

Before a Spearwell tool gets into a garden it goes through a lot of hard work in the factory.

When we finish making a tool we try to undo all the handiwork with a machine. If we fail, we know the tool is a success.

Since Spearwell is a combination of 3 of the most famous names in British gardening (Brades, Elwell and Spear & Jackson) we've had a lot of successes.

*So the 10 year guarantee isn't empty talk. Every Spearwell tool is guaranteed against faulty materials and workmanship for 10 years, handles for 1 year from the date of purchase provided it has been normally used and maintained.

Our word is as good as our tools. We never break it.

BEANPOLE

May in the garden with

Lawn 'Plus' feeds and weeds in one go

Somehow, although you care for your lawn, you never quite get the green of your dreams. There is always something bent on spoiling it, like the unsightly weeds that steal the foods meant for the grass.

So ICI have produced Lawn 'Plus'. Not just a feeder but a weeder too.

Lawn 'Plus' is prepared in the unique form of mini-granules; each mini-granule is a balanced food in an organic base, impregnated with two selective weedkillers to kill most lawn weeds. In one operation, you can clean up the lawn and get the grass growing green and healthy again.

There is the special 'Plu's' Lawn with fire depressant. It remains active Spreader, You just wheel it over the lawn. against most weeds for about six months I rusually costs, s/b but you can get 6/-re- and it does not present the fire hazards of the standard form.

Inspect your roses this month for die-back and prune affected stems to Just above the healthy shoot. Keep a lookout for disease—blackspot, mildew and rust. If you have not treated them aiready, spray your roses thoroughly with ICI General Garden Fungicide. It contains thirms which controls all three diseases as well as many others. Pick off and burn any leaves already infected.

Use 'Weedol' while weeds are young and prevent them taking a hold in the garden. Fit a sprinkle bar to a watering can and just water 'Weedol' on to the weeds, taking care to avoid cultivated plants. It contains ICI's discovery, paraquat, which kills weeds without harming the soil; it is quick and easy to use; saves hours of hand weeding among roses, shrubs, flowers, soff truit and top fruit, between vegetable rows, along fences and hedges, on paths, drives and crazy paring – verywhere in fact, except on lawns.

If you don't know a Thrip from a Weevil, you can be sure that your plants certainly do. And that goes for beetles, leafminers, and caterpillars too! Fortunately, you don't need to, because Sybol' general in-secticide gets rid of the lot and a few more besides. Examine the plants carefully, and if the plant is chewed, bitten or the leaves rolled up (these pets have voracious appetites) spray with 'Sybol' every ten to fourteen days.

This month's gardening hint. Removing a plant from its original pot before final planting will be very much easier and less damaging to the young plant if you do this; turn the pot upside down, secure the stem between your fingers and then tap the pot gently against the bench (or a piece of wood).

liquid feed. It provides the required food when needed most.

It is a good idea also to spray the ground around Aboll the plants to deal with insects which come up from soil. (Do not use Sybol' onhydrangeas, blackcurrants, accumbers or potatose – use 'Abol' Derris Dust instead).

plants are like babies; they need regular liquid feeds. It is when they are growing fast, especially under glass and after bedding out. Liquid 'Plus' is a specially balanced preparation of nitrogen, phosphate and por-ash that makes 70 gallons of

The answer lies in the soil. Prevent and treat club root on cabbages, late, brussels sprouss, and other members of the cabbage family, with comes in handy may be compared to the cabbage family, with comes in handy may be compared to the cabbage family and into dibber on the cabbage family and into dibber holes before seeding and transplanting.
